

Observability for cloud networks

Flowmill provides SRE teams deep visibility into the network behavior of distributed applications using eBPF. It can be deployed in minutes with no changes to an application.

Detect cloud infrastructure problems

Measure how network connectivity and performance issues, misconfigured services, external providers, security settings, and DNS impact your services.

Reduce network costs

Measure cross zone and egress traffic by service even inside Kubernetes clusters so you can correlate network cost with your services.

Analyze application traffic in real-time

Programmatically collect traffic and error rates for all of your service dependencies and identify unknown or unwanted connections.

No code changes | Negligible overhead | Real time | Complete coverage
