

SPLUNK® FOR IT OPERATIONS

Get end-to-end visibility across IT infrastructure and fix problems faster

- **Reduce mean-time-to-resolution (MTTR)** with rapid, data-driven troubleshooting
- **Proactively monitor infrastructure** by correlating events across a variety of machine data
- **Transform IT service monitoring** with analytics delivered by Splunk IT Service Intelligence
- **Eliminate silos** by integrating data from across your infrastructure and systems
- **Detect anomalies** and prevent problems in real time

Today's datacenter has evolved and IT environments are now more complex than ever—so don't let your IT management and monitoring tools leave you a step behind. Legacy systems can be expensive and fail to adapt to changing IT environments. Because they usually operate in silos, these systems can struggle to collect and correlate information from multiple technologies, making it difficult for IT to monitor infrastructure and rapidly troubleshoot problems.

Splunk software changes this all-too-familiar scenario by enabling you to examine your data in depth and in real time from across your IT environment—whether on-premises, in the cloud or hybrid. Splunk software collects and correlates the machine data needed, so you can quickly troubleshoot issues and outages, monitor end-to-end service levels and detect anomalies. Reduce MTTR, lower monitoring costs, improve system uptime and support strategic initiatives like datacenter optimization and tool consolidation.

Transform Service Operations with Machine Learning

Splunk IT Service Intelligence (ITSI) delivers powerful analytics to simplify operations, prioritize issue resolution and provide visibility into critical services.

IT Operations Analytics

Turn the silos of machine data generated in your datacenter into integrated and actionable information. This insight helps you find and fix problems faster than ever before, and reduce your mean-time-to-investigate (MTTI) and mean-time-to-resolution (MTTR) times to keep your critical services running reliably.

Messaging/Identity Infrastructure Monitoring

Monitor, audit, secure and analyze your messaging and identity infrastructures and workloads in one place in real time. Use a customizable Active Directory interface, providing role-based access to support professionals in issue analysis and resolution, while also maintaining compliance.

Virtualization Monitoring

Gain visibility across the virtual stack, make faster event correlations, and search transactions spanning virtual and physical components, all from one place. Bring it all together for troubleshooting and analyzing issues, and security and compliance investigations.

Storage Monitoring

Use out-of-the-box, customizable reports to improve your storage monitoring efficiency and proactively plan storage capacity allocations. Understand your storage system in context with corresponding app performance, server response times and virtualization overhead.

Mobile Intelligence

Deliver better performing and more reliable apps, and gain insight on end user experience. Make mobile data open to developers, operations and line of business users.

OS Monitoring

Eliminate silos with complete operational visibility across heterogeneous environments made of multiple flavors of Windows and Linux operating systems, regardless of deployment model. Correlate system metrics and events data with data from other technology tiers to prevent performance slowdowns and capacity bottlenecks, as well as secure your environment.

Servers and Networks

Troubleshoot problems and outages quickly and detect early warning signs. Collect all logs, configurations, messages, traps and metrics, so you can search, alert and report across your servers in seconds. Integrate Splunk with existing server monitoring and provisioning tools for one-click granular data analysis.

Wire Data Analytics

Get real-time insight into applications performance without the need for deep instrumentation. With the combination of application event capture, real user monitoring and comprehensive infrastructure obtained from streaming network packets, you can achieve end-to-end visibility for an optimal customer experience.

Container Monitoring

Unify insights across all container environments and the entire technology stack. Collect, search and correlate container data with other infrastructure data for better service context, monitoring and reporting. Gain insight on container resource usage, cluster capacity and the impact of increasing cluster use for a specific service.
